Regional forecast 2021

The region faces sluggish growth prospects for 2021, while a return to pre-pandemic economic activity levels is expected to take several years (ILO/ECLAC, November 2020).

Given the severity of the regional economic contraction in 2020 and a slow anticipated recovery, poverty and inequality rates are projected to remain high in 2021, with little respite for food-insecure households (CSIS, November 2020).

COVID-19 cases continued to rise in early 2021, with El Salvador, Nicaragua and Honduras reporting a second wave of infections. Health officials in the Honduran department of Cortés, which was one of the worst-hit departments by hurricanes Eta and Iota, reported a 200 percent increase in COVID-19 consultations since the December 2020 holiday season (OCHA, January 2021).

The accumulated effects of years of weather extremes coupled with worsening economic crises are expected to fuel increases in acute food insecurity for all countries where estimates are available.

Central America is expected to face escalating levels of acute food insecurity due to the disastrous 2020 hurricane season. See figure 2.32.
