AFGHANISTAN

IPC ACUTE FOOD INSECURITY ANALYSIS

April 2020 – November 2020 Issued in May 2020

Afghanistan's food crisis exacerbated by the COVID-19 pandemic with over 10 million acutely food insecure

CURRENT APRIL - MAY 2	020	
	Phase 5	0 People in Catastrophe
10.9M 35% of the population	Phase 4	3,474,000 People in Emergency
People facing	Phase 3	7,383,000 People in Crisis
acute food insecurity (IPC Phase 3+)	Phase 2	10,942,000 People in Stress
IN NEED OF URGENT ACTION	Phase 1	8,926,000 People minimally food insecure

PROJECTED JUNE - NOVEMBER 2020 Phase 5 People in Catastrophe 10.3M Phase 4 3,307,000 People in Emergency 34% of the population Phase 3 7.007.000 People facing acute **People in Crisis** food insecurity 11,532,000 Phase 2 (IPC Phase 3+) **People in Stress** IN NEED OF URGENT Phase 1 8,881,000 **ACTION** People minimally food insecure

Overview

Food insecurity remains alarmingly high in Afghanistan with continuing conflict, widespread unemployment, and price hikes, all exacerbated by the impacts of the COVID-19 pandemic. Around 10.9 million people (35% of the population analysed) are estimated to be in IPC Phase 3 (Crisis) or above in the current period (April-May 2020). These include around 7.38 million people in Crisis (IPC Phase 3) and 3.47 million people in Emergency (IPC Phase 4). In total, four analysis areas were classified in IPC Phase 4 (Badakshan, Daykundi, Hirat Urban and Kandahar Urban).

After the harvest, it is likely the food insecurity situation will improve in rural areas, since households will have increased access to food from own production and prices may also decrease. Despite the overall reduction in people facing acute food insecurity, the number of people in Crisis (IPC Phase 3) and Emergency (IPC Phase 4) in urban areas is expected to increase in the projection period.

In urban centers, the negative economic impacts of COVID-19 are likely to counteract the positive impacts of the harvest. The severity will be higher in areas where humanitarian access is limited. Although food is still available in nearly all markets, the prices of basic food commodities increased by 10 to 20%. The lockdown measures put in place in response to the COVID-19 pandemic significantly decreased daily labour opportunities; reducing household purchasing KeyeDriversd access.

High Food Prices

Unusually high food prices linked to border closures and panic buying, caused by COVID-19, further exacerbate food access of households already living below the poverty line. Food commodity prices have increased by 10 to 20%.

Reduced Employment Opportunities

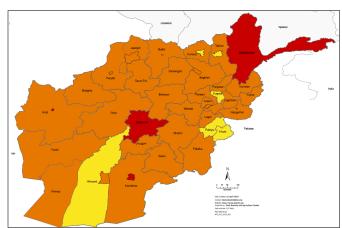

Households are facing an increasing stress on their financial access due to large-scale unemployment, which is expected to worsen as COVID-19 lockdown measures continue

Conflict

Ongoing conflict in many of the analyzed provinces has caused population displacements, affected people's livelihoods or caused them to lose their livelihoods completely. In 2020, there have been an estimated 65,000 newly internally displaced people (IDPs) as a result of conflict.

Current Situation April - May 2020

Projected Situation June - November 2020

Key for the Map IPC Acute Food Insecurity Phase Classification

(mapped Phase represents highest severity affecting at least 20% of the population)

SITUATION OVERVIEW AND KEY DRIVERS

Current Situation Overview (April - May 2020)

In the current period, corresponding to the final period of the lean season and pre-harvest, 10.9 million (35% of the population) were estimated to be in IPC Phase 3 (Crisis) and Phase 4 (Emergency). This includes 3.5 million (11%) classified in IPC Phase 4 (Emergency) nationwide and 7.4 million (24%) in IPC Phase 3 (Crisis). Of the 45 areas analysed, 4 areas were classified in IPC Phase 4 (Emergency), (Badakshan and Daykundi, and Urban areas of Hirat and Kandahar), 35 areas in IPC Phase 3 (Crisis), and 6 areas in Phase 2 (Stress).

In this period, and until the June harvest, most households have already depleted their food stocks from the previous harvest and are more reliant on markets for food purchase as they are not self-sufficient in production. Only 45% of households reported access to land. Among them, around 50% cultivated less than 1 acre. Across all areas only a very small proportion of households reported having cereal stocks from their own production that would last till the next harvest. These vulnerable conditions are further aggravated by the COVID-19 pandemic, which has seen a surge in food prices. Overall, an estimated 10-20% price increase has been observed compared with the same period last year. The COVID-19 related price rises are in addition to the already steadily accelerating year-on-year inflation. Along with reduction in income, an increase in debts was observed in recent assessments. Around 80% of households reported having debt and 56% stated the level of debt had increased compared to previous year. One out of four households (25%) have adopted Emergency livelihood coping strategies and nearly the same proportion of households (23%) have adopted Crisis livelihood coping strategies to mitigate their food consumption gaps.

Unemployment continues to be a major driving force for economic vulnerability in Afghanistan and a small proportion of households have access to productive or sustainable remunerative employment. A quarter of the labour force is unemployed, and 37% of employment is 'vulnerable' and insecure, comprising self-employment, day labour, or unpaid work. Around 60% of households (70% for urban households) reported that their income levels had decreased compared to the previous year, with the main cause being reduction in income activities. The partial or complete lockdowns in major towns have led to a further decrease in employment opportunities, leading to additional strain on the most vulnerable households and further limiting their purchasing power.

The impacts of COVID-19 are estimated to be less severe in rural areas as households may have access to food stocks from their own production and do not face the same restrictions imposed by the lockdowns. However, where rural markets are integrated with major urban markets, the lockdowns have seen disruption in supply to dependant rural markets, as observed in the Northern regions of Afghanistan, where the rural markets of Samangan, Jawzjan and Sar-e-pul are closely integrated with Mazar as the main market in the north. The extended lockdown in Mazar affected flow of food items to the dependant rural areas challenged food availability, especially in remote districts of these provinces.

Partial border closures with Pakistan and Iran have affected the main supply routes for critical items, notably, food. Recently, there have been sporadic openings to allow commercial vehicles to pass into Afghanistan. Kazakhstan, being an important supplier of wheat and wheat flour to Afghanistan, had also imposed restrictions that resulted in an abrupt price hike of wheat flour and oil. However, Kazakhstan has lifted the ban, after some time. The global impacts of the COVID-19 pandemic have also seen the flow of remittances impacted, as many Afghans abroad faced unemployment and reduced incomes.

Moreover, these issues are compounded with years of conflict and instability that have caused livelihood disruption and displacements. Despite efforts at a peace deal, this has not yet translated into sustained reduction in violence on the ground. In the first quarter of 2020, an estimated 65,000 additional people have been displaced. Continued violence is now seen as a threat not, only to the immediate safety and well-being of community, but also to overall public health as it may hinder the diseases detection and the delivery of life-saving medical care. Returnees from Iran and Pakistan also continue to add stress to the livelihoods of households. Overall food insecurity is estimated to be higher in urban areas with the price hike and economic downturn caused by COVID-19.

In the months of April and May, the distribution of humanitarian food assistance in Afghanistan tends to be low and is generally targeted towards displaced populations and people affected by floods. As per the plans, 557,861 people will be assisted in April and 616,634 people will be assisted in May across all provinces. Although the IPC criteria for significant assistance to be mapped out was not met in any of the areas, the levels of assistance are relatively high in Badghis and Uruzgan.

Internal displacement is not only limited to new IDPs displaced in the first quarter of 2020, there are also IDPs from previous years who are unable to return to their places of origin mainly because of continued conflict, loss of livelihoods and lack of economic opportunities. More details are provided in the IDP section of this report.

Projected Situation Overview (June - November 2020)

During the projection analysis period, from June to November 2020, the total population in IPC Phase 3 (Crisis) and IPC Phase 4 (Emergency) is expected to decrease to 10.3 million (34% of the population), with 7,007,000 (23%) of the population in Crisis (IPC Phase 3) and 3,307,000 (11%) in Emergency (IPC Phase 4). The downward trend in food insecurity follows the expected seasonal patterns of harvest, even in likely consideration of the direct and indirect effects of COVID-19 on food security.

Similarly, the number of Phase 4 (Emergency) areas is expected to decrease to 2 from 4, as Daykundi and Hirat urban are classified in IPC Phase 3 (Crisis) in the projection period. The number of areas classified in IPC Phase 3 (Crisis) is expected to increase from 35 areas in the current analysis to 40 areas in the projection period, as more provinces will move to an IPC Phase 3 (Crisis) situation from IPC Phase 4 (Emergency) and Phase 2 (Stress), depending on the extent of impacts of harvest and likely impact of COVID-19.

The overall number of people facing acute food insecurity is on the rise in urban settlements, and the upheaval set in motion by the COVID-19 pandemic will push even more families and communities into more vulnerable conditions in the projection period. Urban hubs such as Kabul, Hirat, Mazar, Nangarhar and Kandahar are already hard hit by the impact of COVID-19 on the economic accessibility to food. In these centres, a more pronounced increase in food insecure population is expected, compared to other areas analysed in the projection period. Lockdowns instituted to limit the exposure of residents to COVID-19 continue throughout the country, resulting in closures of these main cities. The overall situation suggests that these lockdowns will not be rescinded anytime soon. Skilled and unskilled wage labour, small businesses and remittances are among the main income sources for household, both in urban and rural areas, which are highly affected by the impacts of COVID-19 and will continue to be affected in the projection period. Purchasing power will be further reduced due to reduction in income, and as a consequence, households' financial access to food will be strained. Most returnees from Iran are coming back to Afghanistan due to reduced employment opportunities and due to COVID-19 related fears. Amid the economic crisis, the demand for foreign daily labourers reduced in Iran and Pakistan. People will face a complex situation of decreased remittance, low to no employment opportunities and more competition in the job market due to returnees from Iran and Pakistan.

As per FEWSNET's data, most of the country received average to above average precipitation. Only Balkh, Kunduz, Takhar and Badakhshan in the north and northeast experienced precipitation deficit. Wheat cultivation and production, especially in rain-fed areas, is directly dependent upon adequate and timely precipitation. Looking at the precipitation level and remote sensing data collected by FEWSNET, it is estimated that the harvest will be close to average this year. The harvest period, anticipated between June and August, will improve the food security situation not only by improving the availability of food, but also by increasing agriculture wage labour opportunities, especially in rural areas of the country. However, as per a rapid assessment conducted by MAIL and FAO, further yield reduction is anticipated due to outbreak of rust in 14 provinces (Kunduz, Samangan, Balkh, Sar-e-pul, Faryab, Baghlan, Uruzgan, Nimruz, Kandahar, Helmand, Farah, Kunar, Nangarhar, Hirat).

Based on population estimations of 2019, wheat demand in the country is calculated to be around 6 million metric tons. Considering the level of harvest this year and annual population growth rate, wheat deficit is expected to be around 1.5 million metric tons in 2020. Afghanistan is once again facing wheat deficit in a situation where the supply chain of wheat and wheat flour is expected to be disrupted due to measures put in place in response to the COVID-19 outbreak. Although border crossings are open for commercial goods, Kazakhstan imposed quota on its wheat export to its neighbouring countries. It is anticipated that Afghanistan will not be able to import its full wheat and wheat flour requirements from Central Asian countries and the shortage in supply may slightly affect food prices in projection period.

Afghanistan is at a precarious moment with respect to the long-standing conflict. Although the government is negotiating the terms of a peace deal, the insurgent groups still continue to attack Afghan forces. Over two weeks in late March and early April, more than 500 attacks across nine provinces were reported, which were also among the worst hit by the COVID-19 pandemic. If a peace deal does not materialize, conflicts could increase in the projection period. This will likely trigger further internal displacement, and cause further food insecurity.

HINDERED ECONOMIC ACCESS TO FOOD DUE TO COVID-19 IMPACT

For the first time, 11 major towns of selected provinces were also analyzed, to assess the specific vulnerabilities of urban households. Across the urban areas, around 2.48 million people (34%) are classified in IPC Phase 3 (Crisis) and above, of which 834,000 people (11%) are classified in IPC Phase 4 (Emergency). Of these 11 cities, two were classified in IPC Phase 4 (Emergency), namely Hirat and Kandahar urban centres, and seven were classified in IPC Phase 3 (Crisis), namely Mazar (in Balkh Province), Pul e Khumri (Baghlan), Kabul, Jalalabad (Nangarhar), Shibirghan (Jawzjan), Lashkargah (Hilmand) and Maimana (Faryab). Two towns were classified in IPC Phase 2 (Stressed), Kunduz, and Taluqan (Takhar). The number of food insecure people is expected to increase in the projected period (June to November 2020) to 2.72 million people, as the economic impacts of COVID-19 lockdown measures are expected to outweigh the positive impacts of the harvest season.

Overall, the urban areas of Afghanistan are expected to be more acutely impacted by the COVID-19 pandemic, and in particular, by the widespread economic downturns caused by the lockdown and restriction measures on the macro-economic and productive sectors across major cities and towns. The most vulnerable groups will be particularly at risk. These groups include daily wage labourers (especially non-agriculture labour in urban areas), IDPs and returnees, people relying on remittances, service sector workers and small traders. In total, around 34% of the analyzed population relies on income sources that are directly exposed to the economic shocks caused by the lockdowns. Additionally, households in urban areas are more reliant on markets for food and, therefore, do not have sufficient stocks from their own agricultural production to cover consumption needs. The spike in market food prices had severe impacts on urban food insecurity. Moreover, 70% of urban households reported a decrease in income. Around two thirds of them attributed the reduction to decreasing employment opportunities. This proportion is expected to increase substantially if the ongoing lockdown measures will keep in place, which is considered the most likely scenario. Furthermore, the flow of urban to rural remittances as well as the cross-country transfers from Iran and other countries has been severely impacted by global lockdowns and large-scale unemployment due to COVID-19.

The most vulnerable urban centres in the current period are in Hirat and Kandahar, which are the hardest hit by the impacts of COVID-19. Hirat, in particular, is at the centre of the crisis, with an escalating flux of returnees from Iran fleeing the outbreak in the country. Moreover, with the heavy reliance on daily wage labour activities in Iran, young returnees have found those income earning opportunities reducing, forcing them to return to Afghanistan. Kabul city and Jalalabad city in Nangarhar province are also extremely vulnerable, not only the movement restriction but also the large influx of displaced populations that have moved to these areas to escape conflict and in search of better economic prospects. As the capital and centre with more employment opportunities and fewer sources of conflict, Kabul is a major hub for the displaced populations. Kunduz and Taluqan (Takhar province) show a slightly better food security situation, as both have flat lands with high agricultural production. The favourable precipitation last year boosted their local agricultural production, so both provinces have surplus wheat production. Good local production has positively impacted the overall situation not only in rural but also in the urban markets; therefore both areas are classified in IPC Phase 2 (Stress).

In the projection period, the impact of COVID-19 on financial access is expected to continue in urban areas. A considerable number of urban dwellers shall migrate to rural areas in response to decreased employment opportunities in urban regions, increasing food prices and higher probability of exposure to COVID-19. If export restrictions from Kazakhstan continue, there is an anticipation that price levels may spike again in the projection period. Additionally, if movement restrictions are not lifted and livelihoods are not back to normal by June 2020, there would be large food consumption gaps and adoption of significant Emergency coping strategies. For this reason, an update to this IPC acute food insecurity analysis is strongly recommended by the first week of June 2020, in case the COVID-19 pandemic is not under control by then, and in case movement restrictions are not lifted.

Population table for the current period for the 11 major urban cities: April - May 2020

Urban centres	Total	Phase 1		Phase 2		Phase 3		Phase	4	Phase	5	Area	Phase 3-	+

Note: These numbers are also included in provincial population tables in order to inform overall situation at provincial level.

FOCUS ON INTERNALLY DISPLACED PEOPLE (IDPs)

Note: Although IDPs are included in the population estimates provided by the Flowminder tool (see annex), they have not been classified into different phases of IPC, so it was impossible to conduct a separate specific analysis of IDP food insecurity. Recognizing the impact of IDPs in urban areas on IPC phase classification and their level of food insecurity, the IPC Technical Working Group considers it important to provide a description of this group. The IPC TWG will do further efforts to verify availability of data specifically documenting the food security situation of IDPs and explore the opportunity to in future conduct a specific analysis.

Decades of war and violent conflict compounded by economic problems and natural disasters have pushed millions of individuals into displaced communities within and outside the country. Rural communities mainly migrated to nearby urban or semi-urban settlements where security is relatively better, and land is still affordable, though necessities are often unavailable.

Usually, because of the severity of the conflict, most of the livelihood assets of these vulnerable IDPs are either looted, killed or sold at very low prices. IDPs leave with almost nothing, and can result in human loss and physical disabilities. Most of the IDPs bring agriculture-based livelihoods skills to these urban areas where there is no market for their skills. Their arrival increases the pressure on the local job market, reducing wages and adding strain on infrastructure, ultimately fuelling tensions and conflict with the local population.

Conflict remained one of the main drivers of humanitarian needs in 2019 and in previous years. On average, half a million people leave their homes every year because of the conflict. Most of these IDPs (75%) are found in need of urgent humanitarian assistance as per the historical trend data from FSAC Afghanistan. Though there are various assessments and definitions of IDPs in Afghanistan, IDPs are mainly categorized under new, prolonged or protracted IDPs. According to the internal displacement monitoring centre (iDMC) there were 2,993,000 IDPs in Afghanistan in December 2019.

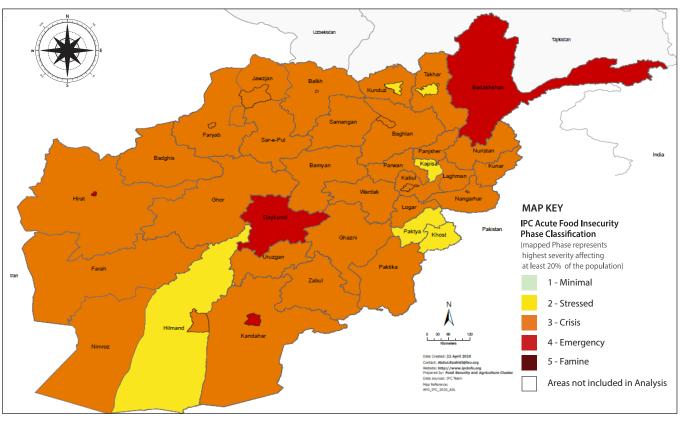

According to OCHA's IDP tracking data, a total of 65,000 IDPs fled their homes from January to mid-April 2020.

Food security situation for displaced populations: Various assessments conducted on IDPs by IPC partners show worse food security scores on indicators compared to any other population's category in Afghanistan. According to these assessments, more than 90% of the IDPs have an either poor or borderline food consumption score; none to one-week food stock maximum; very low level of income, far below the cost of a basic food basket; and a high level of debts. In 2019, REACH conducted an assessment with different vulnerable groups on the move, that included new and prolonged IDPs, returnees and refugees; these people on the move are mostly concentrated in 11 urban areas (Nangarhar, Hirat, Kabul, Faryab, Takhar, Kunduz, Kandahar, Hilmand, Balkh, Baghlan and Jawzjan) where urban analysis is conducted.

According to the findings of the assessment on the newly displaced in 2019, 76% of the IDPs have an either poor or borderline food consumption score, whereas surprisingly, in prolonged IDPs, this is even higher, with 79% IDPs having a poor or borderline food consumption score. Aligning the response with these numbers, the Food Security and Agriculture Cluster of Afghanistan aims to target 75% of the newly displaced IDPs with a multi sector response.

Recommendations: This report urges partners to continue supporting new IDPs as the most vulnerable group for the response. This report also urges partners to include prolonged IDPs in the response, as their situation is not very different from that of new IDPs, since they became more vulnerable because of the COVID-19 pandemic as they were relying on unsustainable sources of income. In many areas, these IDPs are unable to return to their places of origin, so appropriate measures should be taken to support them.

CURRENT IPC ACUTE FOOD INSECURITY SITUATION (APRIL - MAY 2020)

Note: Around 10.9 million people (35% population) are estimated to be facing IPC Phase 3 (Crisis) or above in the current period (April-May 2020). These include around 7.38 million people in Crisis (IPC Phase 3) and 3.47 million people in Emergency (IPC Phase 4). A total of 4 analysis areas were classified in IPC Phase 4 (Badakshan, Daykundi, Hirat Urban and Kandahar Urban).

IPC population table for current period: April – May 2020

RECOMMENDATIONS FOR ACTION

Response Priorities

Food insecurity can further deteriorate both during the current and projected periods, due to possible economic impacts of COVID-19 on production and markets. The food insecurity situation can change from best to worst case scenario, that will require a very large sale response. Situation monitoring and further analysis are required to align the size of the response with the changing situation. To address the acute food insecurity needs of the affected families, the following actions are required to save lives and livelihoods:

- Immediate action is required to contain the high rate of asset depletion and food consumption gaps through food assistance for the population classified in IPC Phase 4 (Emergency) and IPC Phase 3 (Crisis). The modality (cash or in-kind) of the food assistance should be considered based on proper market analysis, as prices of food commodities are significantly high and border closures can further disrupt economical food access.
- Livelihood assets creation programmes should be considered where possible, while providing cash or in-kind assistance to construct and rehabilitate water infrastructure for agriculture and livestock such as tube-wells, water channels and reservoirs for better conservation and management.
- Food assistance should be prioritised in urban areas, especially for those relying on daily wage labour and unsustainable sources of income. Humanitarian agencies should follow government guidelines and international practices during distribution in the context of the COVID-19 pandemic.
- Rural farmers will not be able to get labour opportunities, especially small and medium farmers, so they may consume all of their harvest during this challenging lockdown period. Around 74% of farmers reported a lack of seed for next cropping season. Timely provision of quality seeds will help farmers not only to cultivate but also increase the production for household consumption.
- The government must facilitate a smooth flow of food supply chain during the lockdown. Crop pest and disease monitoring and control should continue to avoid losses.
- Introduce livelihood diversification programmes for the people facing Crisis (IPC Phase 3) and Emergency (IPC Phase 4) levels of food insecurity, especially female-headed households and people with disabilities. Livestock support, poultry and kitchen gardening are potential activities to enhance food security, nutrition and income of vulnerable communities.
- Considering the regular occurrence of environmental shocks, stakeholders should also focus their attention and funding on programs to build resilience to disasters and reduce disaster risks. Afghanistan already entered in the flooding season, so measures should be taken to avoid loss of lives and livelihoods.
- The complex context of Afghanistan, including ethnically diverse people, rugged terrain and continuing civil unrest, needs to be considered when developing strategies for food and livelihood security programming.

Situation Monitoring and Update of Activities

In the recent context of COVID-19 monitoring of the food security situation along with health issues is more important than ever. The following situations should be monitored:

- The recent lockdown in major urban centres of the country as a result of the COVID-19 pandemic significantly damaged the urban wage sector. Afghan urban communities are highly dependent on these opportunities, so measures should be taken to monitor the performance of the urban wage sector and its impact on food security of the urban poor.
- Afghanistan is highly dependent on the import of staple food; recent border closures significantly impacted food availability and prices in the country. Though we are at the beginning of the harvest, close monitoring of the harvest and borders are required to predict the food availability situation in the country.
- Food price monitoring should also continue in the major markets of the country and measures should be taken to expand food price monitoring, as most of the communities are relying on the purchase of food from local markets.
- Crop pest and diseases and livestock diseases should be monitored, as these can potentially impact crops and livestock in 14 provinces of the country as per the historical trends.
- Abnormal rainfall patterns which would increase the probability of natural hazards such as droughts and floods; on average, spring floods affect approximately 200,000 vulnerable people every year.
- The deterioration of the security situation in provinces, which triggers the displacement of rural population to cities during the current and projection analysis periods, including during spring, can increase the probability of conflict. On average, around 500,000 people migrate to secure areas every year because of conflict.
- The flow of returns remained highest during March and April 2020 in comparison with previous trends because of the COVID-19 pandemic, especially from Iran. High rate of return and decrease in remittances should be monitored, as these will affect food access and further saturate an already stressed urban labour market.

PROCESS, METHODOLOGY AND LIMITATIONS

Process and Methodology

Due to the current context of travel restrictions and containment, the Afghanistan IPC TWG, in collaboration with the IPC Global Support Unit, has adapted its usual approach of having an in-person country analysis, by leveraging existing technologies and tools, such as the web-based IPC Information Support System (ISS), and a large pool of experienced food security and nutrition analysts. Through this virtual analysis process , the IPC initiative is successful in ensuring that analyses conducted during this period capture the effects of COVID-19 on food insecurity and malnutrition.

The virtual IPC AFI analysis was conducted from the 6th to the 16th April 2020 assessing two periods: the current period (April to May 2020) was based on surveys and data collected from 2019-2020 that reflected existing factors that lead to food insecurity; and the projected period (June 2020 to November 2020) considering the current period contributing factors, outcome evidences with the projection assumptions factors. The analysis covered all 34 provinces of the country, for 23 provinces at provincial level and for the remaining 11 provinces, rural and major urban centres separately analysed making the total analysis units to 45. International technical experts were committed to providing remote technical support to the country team. A remote support team was formed within the IPC Global Support Unit (IPC GSU) that was on stand-by to support analysis co-leads throughout the analysis workshops. The data used in the analysis were organized according to the IPC analytical framework, which includes predefined food security contributing factors and outcome indicators. All data were collected from a wide range of sources, including reports from the Ministry of Agriculture, Irrigation and Livestock, other government institutions at national and provincial levels, and international organizations

Limitations of the analysis

This IPC AFI analysis was conducted virtually in the 2nd and 3rd week of April 2020 for the first time in Afghanistan; due to COVID-19 lockdown strict restrictions on movement. This contained some minor challenges such as weak internet connectivity and unstable electricity power for most of the areas. The virtual IPC AFI analysis was undertaken by core analysts with technical support of the national co-facilitators, international technical experts from IPC RSU and GSU and the context focal points in the provinces. The number of days allocated to the analysis increased to 9 from the usual 5 days to provide the analysts with the sufficient time to complete the analysis. MIS officers from MAIL were the only government staff who participated in the analysis process, since they are amongst those who are familiar with IPC protocols and the ISS online portal. Afghanistan population estimations based on NSIA estimates do not include the population of Kuchis /Nomads (1.5 million people) at the provincial level, therefore this group of people have not been considered in the phase classification of any certain area. Additional time allowed proper discussion on the phase classification to build technical consensus. It is important to note, that consensus was reached among all the stakeholders except FEWSNET. FEWSNET respectfully disagreed with the phase classifications of 5 and 23 areas for current and projection respectively, out of 45 analysis areas, as well as with the overall estimated population in Phase 3 and higher. FEWSNET advocated for the less severe situation by suggesting lower area classification and population estimates. with which the TWG disagreed.

IPC Analysis Partners

ACTION AGAINST HUNGER

What is the IPC and IPC Acute Food Insecurity?

The IPC is a set of tools and procedures to classify the severity and characteristics of acute food and nutrition crises as well as chronic food insecurity based on international standards. The IPC consists of four mutually reinforcing functions, each with a set of specific protocols (tools and procedures). The core IPC parameters include consensus building, convergence of evidence, accountability, transparency and comparability. The IPC analysis aims at informing emergency response as well as medium and long-term food security policy and programming.

For the IPC, Acute Food Insecurity is defined as any manifestation of food insecurity found in a specified area at a specific point in time of a severity that threatens lives or livelihoods, or both, regardless of the causes, context or duration. It is highly susceptible to change and can occur and manifest in a population within a short amount of time, as a result of sudden changes or shocks that negatively impact on the determinants of food insecurity.

Contact for further Information

Rashidi, Abdul Baies

National IPC Officer abdul.rashidi@fao.org

IPC Global Support Unit www.ipcinfo.org

This analysis has been conducted under the direct patronage of the Ministry of Agriculture Irrigation and Livestock (MAIL) and Food Security and Agriculture Cluster (FASC) Afghanistan.

Classification of food insecurity and malnutrition conducted using the IPC protocols, which are developed and implemented worldwide by the IPC Global Partnership - Action Against Hunger, CARE, CILSS, EC-JRC , FAO, FEWSNET, Global Food Security Cluster, Global Nutrition Cluster, IGAD, Oxfam, PROGRESAN-SICA, SADC, Save the Children, UNICEF and WFP.

Sources

Data sources used for the analysis included: 1) The Food Security Monitoring System (FSMS) 2019-2020 conducted by the World Food Programme (WFP). 2) The Agriculture Prospect Report (APR) and Food Price data – MAIL. 3) The SMART Surveys 2018, 2019 and 2020 from AAH, MoPH & UNICEF. 4) Population Estimation from the National Statistics Information Authority (NSIA) of Afghanistan. 5) ALCS, 2016-2017- NSIA. 6) Food Prices and Food Distribution reports from WFP. 7) Climate, Precipitation, NDVI, Food security outlooks – FEWSNET. 8) Refugee & IDP data from UNHCR, OCHA, FSAC and IOM. 9) Natural disaster affected population data from IOM and FSAC. 10) Precipitation, temperature, snow, landside, earthquake, avalanche and flood – iMMAP. 11) 2016 Land Cover Atlas from FAO. 12) The Whole of Afghanistan Assessment from REACH International. 13) Humanitarian Food Assistance (HFA) - FSAC 14) Multi hazard risk assessment and capacity report Analysis – ANDMA. 15) Lockdown Status – UNDSS. 16) COVID-19 outbreak – MoPH. 17) Data on humanitarian assistance delivered and planned from WFP and localized assessment conducted by I/NGOs.

IPC Acute Food Insecurity Phase Classification

Since 2011, the National Statistics and Information Authority (NSIA) has been conducting a form of rolling census, the Socio-Demographic and Economic Survey (SDES), which includes enumeration for 50% of households (the survey has covered around 12 of the 34 provinces). The main challenge of this process was the lack of reliable current disaggregated population data at provincial and district level. For some of the provinces, including Helmand, Zabul, Daykundi and Paktika, the population is solely based on the 1979 census projections because no household listing data was available at the time of the population rebasing in 2004. As such, Afghanistan's official population estimates are significantly underestimated, and it is recommended that alternate estimates based upon household listing projections be used for programmatic purposes. Therefore, the Government requested the United Nations to assist the NSIA in estimating spatially disaggregated population data through a collaborative partnership of Government/UNFPA/Flowminder/World Pop to generate population counts disaggregated by age and sex at district level for the entire country.

Survey data (SDES and micro census), GIS data and Satellite imagery were among key sources of Flowminder population estimations. Statistical modelling was used to estimate population counts for areas with no population data. Flowminder population estimates have been submitted to the cabinet, endorsement is pending due to the current political situation. The IPC, being housed by MAIL, has been using NSIA population figures. However, development partners have been using Flowminder population in HNO/HRP etc. and requested the IPC to provide tables based on Flowminder population so that they can be used readily and to avoid confusion.

Annex
